Burundi s wind power system

Overview

Energy in is a growing with tremendous potential. As of 2020 , Burundi consumes a total of 382.70 million kilowatt hours (kWh) of electric energy per year. The country produces locally 69% of the electricity it consumes, with the rest imported from other countries. Its most important power source is hydroelectric power, representing 95% of total pro.

Small wind turbines need an average wind speed at least 4 m/s, meaning Burundi's wind could support electricity generation ("Wind Explained" 2022). One study found that total wind power potential in the country is 12-15 TWh per year (Mentis 2013).
