Does liquid-cooled energy storage require fire protection

Overview

Fire protection requirements for energy storage equipment include: compliance with national and local codes, installation of appropriate fire suppression systems, continuous monitoring for thermal runaway, and routine maintenance and inspection. Are lithium-ion battery energy storage systems fire safe?

With the advantages of high energy density, short response time and low economic cost, utility-scale lithium-ion battery energy storage systems are built and installed around the world. However, due to the thermal runaway characteristics of lithium-ion batteries, much more attention is attracted to the fire safety of battery energy storage systems.

Are battery energy storage systems a fire hazard?

“The main fire risks in battery energy storage systems stem from thermal runaway, an event where a cell overheats and triggers a chain reaction within neighbouring cells,” EticaAG’s CTO says. 1.

Are LFP batteries safe for energy storage?

Fire accidents in battery energy storage stations have also gradually increased, and the safety of energy storage has received more and more attention. This paper reviews the research progress on fire behavior and fire prevention strategies of LFP batteries for energy storage at the battery, pack and container levels.

How to protect battery energy storage stations from fire?

High-quality fire extinguishing agents and effective fire extinguishing strategies are the main means and necessary measures to suppress disasters in the design of battery energy storage stations . Traditional fire extinguishing methods include isolation, asphyxiation, cooling, and chemical suppression .

How does liquid cooled technology affect fire safety?

AGES OVER TRADITIONAL AIR-COOLING LITHIUM-ION

TECHNOLOGIES Conventional air-cooled systems use fans to pull in external air, potentially introducing humidity and condensation (i.e., water ingress) into the system, which can lead to short-circuiting and thermal events. Instead, liquid-cooled technology offers improved fire safety, among others.

Can a battery pack cause a fire?

Wang's group built a full-scale energy storage system fire test platform in China and studied the battery cluster level fire behavior. They found that a fire in a battery pack can cause TRP between two non-contacting packs, which revealed that TR of battery packs can jump propagate through flame radiation.
