Ethiopia air-cooled energy storage system

Overview

What is compressed air energy storage (CAES)?

Among all energy storage systems, the compressed air energy storage (CAES) as mechanical energy storage has shown its unique eligibility in terms of clean storage medium, scalability, high lifetime, long discharge time, low self-discharge, high durability, and relatively low capital cost per unit of stored energy.

Why should energy storage systems be incorporated into energy systems?

The intermittency nature of renewables adds several uncertainties to energy systems and consequently causes supply and demand mismatch. Therefore, incorporating the energy storage system (ESS) into the energy systems could be a great strategy to manage these issues and provide the energy systems with technical, economic, and environmental benefits.

How are energy storage systems classified?

The most common methods for classification of ESSs are based on energy usage in a specific form, including electrical energy storage (EES) and thermal energy storage (TES), or based on the types of energy stored in the system (kinetic or potential; thermal, electrical, mechanical, chemical, etc.) [11, 18, 23].

How is high-pressure air stored?

The high-pressure and high-temperature air is cooled before being stored in an air reservoir. The thermal energy can be dissipated into the atmosphere, stored in TES, or used for heating applications. In the discharging process, stored high-pressure air is released whenever the electricity is required.
