# Household energy storage penetration in Finland

## Overview

---

With electricity prices swinging like a pendulum and winter nights lasting longer than a Karelian folk song, 63% of Finnish homeowners now consider energy storage essential, according to 2025 market data [6].

With electricity prices swinging like a pendulum and winter nights lasting longer than a Karelian folk song, 63% of Finnish homeowners now consider energy storage essential, according to 2025 market data [6].

A review of the current status of energy storage in Finland original version: Lieskoski, S., Koskinen, O., Tuuf, J., & Björklund-Sänkiahö, M. (2024). review of the current status of energy storage in Finland and future development prospecting details, and we will remove access to the work.

The predominant electrical energy storage (in terms of energy capacity) built by 2040 in Finland will be battery installations. In the second place are hydrogen technologies. However, it is worth mentioning that hydrogen technologies got approximately two times less votes than battery technologies.

The German energy storage market is expected to grow rapidly from 8 GW in 2023 to 38 GW in 2030, with residential energy storage occupying an important position. By September 2023, Germany has installed more than 1 million residential energy storage systems and expects to add more than 400,000.

4 World Energy Issues Monitor survey results. Risk to Peace, Affordability and Acceptability is very high and above all other issues. Additionally, Demand management, H2 & P2X and Domestic Growth stand out distinctly from other critical uncertainties in Finland. Uncertainty surrounding these.

With electricity prices swinging like a pendulum and winter nights lasting longer than a Karelian folk song, 63% of Finnish homeowners now consider energy storage essential, according to 2025 market data [6]. But this isn't just about surviving polar nights; it's about thriving in the clean energy.

Market Forecast By Technology (Lead-Acid, Lithium-Ion), By Utility (3 kW to <6 kW, 6 kW to <10 kW, 10 kW to 29 kW), By Connectivity Type (On-Grid, Off-Grid), By Ownership Type (Customer-Owned, Utility-Owned, Third-Party Owned), By Operation Type (Operation Type, Operation Type) And Competitive. What is the future of energy storage in Finland?

Reserve markets are currently driving the demand for energy storage systems. Legislative changes have improved prospects for some energy storages. Mainly battery storage and thermal energy storages have been deployed so far. The share of renewable energy sources is growing rapidly in Finland.

Is the energy system still working in Finland?

However, the energy system is still producing electricity to the national grid and DH to the Lempäälä area, while the BESSs participate in Fingrid's market for balancing the grid . Like the energy storage market, legislation related to energy storage is still developing in Finland.

Is energy storage the future of wind power generation in Finland?

Wind power generation is estimated to grow substantially in the future in Finland. Energy storage may provide the flexibility needed in the energy transition. Reserve markets are currently driving the demand for energy storage systems. Legislative changes have improved prospects for some energy storages.

Is energy storage legal in Finland?

Like the energy storage market, legislation related to energy storage is still developing in Finland. The two are intertwined as who is allowed to own and operate energy storages will define the business models of the storages. A major barrier to the implementation of ESS was removed when the issue of double taxation was solved.

Which energy storage technologies are being commissioned in Finland?

Currently, utility-scale energy storage technologies that have been commissioned in Finland are limited to BESS (lithium-ion batteries) and TES, mainly TTES and Cavern Thermal Energy Storages (CTES) connected to DH systems.

What factors influence the development of energy storage activities in

Finland?

Several parameters are influencing the development of energy storage activities in Finland, including increased VRES production capacities, prospects to import/export electricity, investment aid, legislation, the electricity and reserve markets and geographic circumstances.
