# New calcium ion energy storage

## Overview

---

Abstract: Calcium batteries (CBs) are potential next-generation energy storage devices, offering a promising alternative to lithium-ion batteries due to their theoretically high energy density, better safety, and lower costs associated with the natural abundance of calcium. Can calcium ion batteries be used as electrochemical energy storage devices?

Calcium-ion batteries (CIBs) have potential as electrochemical energy storage devices due to the low redox potential of  $\text{Ca}^{2+}/\text{Ca}$  and the abundant reserves of Ca. However, the unsatisfactory calcium storage performance of electrode materials limits the development of CIBs. Here, we propose a design principle

Can high-solvation electrolytes achieve ultrastable calcium-ion storage?

However, the unsatisfactory calcium storage performance of electrode materials limits the development of CIBs. Here, we propose a design principle of high-solvation electrolytes to achieve ultra-stable calcium-ion storage.

Are rechargeable calcium-ion batteries a viable alternative to lithium ion battery?

Rechargeable calcium-ion batteries (CIBs) are promising alternatives for use as post-lithium-ion batteries because of the merits of high theoretical capacity and abundant sources of Ca anode, low redox potential and the divalent electron redox properties of calcium.

Are rechargeable calcium (Ca) metal batteries a good choice?

Rechargeable calcium (Ca) metal batteries are among the most promising candidates because of their advantageous features, such as high crustal abundance, high theoretical capacity, and ideal redox potential 5, 6, 7.

Are new chemistries needed for larger scale energy storage systems?

As new uses for larger scale energy storage systems are realized, new

chemistries that are less expensive or have higher energy density are needed. While lithium-ion systems have been well studied.
