New generation of all-flow batteries

Overview

Scientists from the Department of Energy's Pacific Northwest National Laboratory have successfully enhanced the capacity and longevity of a flow battery by 60% using a starch-derived additive, β -cyclodextrin, in a groundbreaking experiment that might reshape the future of large-scale.

Scientists from the Department of Energy's Pacific Northwest National Laboratory have successfully enhanced the capacity and longevity of a flow battery by 60% using a starch-derived additive, β -cyclodextrin, in a groundbreaking experiment that might reshape the future of large-scale.

Flow batteries are emerging as a transformative technology for large-scale energy storage, offering scalability and long-duration storage to address the intermittency of renewable energy sources like solar and wind. Advancements in membrane technology, particularly the development of sulfonated.

This technology strategy assessment on flow batteries, released as part of the Long-Duration Storage Shot, contains the findings from the Storage Innovations (SI) 2030 strategic initiative. The objective of SI 2030 is to develop specific and quantifiable research, development, and deployment (RD&D).

Scientists from the Department of Energy's Pacific Northwest National Laboratory have successfully enhanced the capacity and longevity of a flow battery by 60% using a starch-derived additive, β -cyclodextrin, in a groundbreaking experiment that might reshape the future of large-scale energy.
