Number of solar power generation users

Overview

includes as well as local , mostly and increasingly from arrays. In 2024, utility-scale solar power generated 218.5 (TWh) in the United States. Total solar generation that year, including estimated small-scale generation, was 303.2 TWh. As of the end of 2024, the United States had 239 (G.

Solar's share of U.S. electricity generation has risen from less than 0.1% in 2010 to nearly 8% today. Solar has grown to play an increasing role in many states, now making up more than 20% of electricity production in four states.

Solar's share of U.S. electricity generation has risen from less than 0.1% in 2010 to nearly 8% today. Solar has grown to play an increasing role in many states, now making up more than 20% of electricity production in four states.

There are now 255 gigawatts direct-current of solar capacity installed nationwide, enough to power over 43 million homes. In the last decade, solar deployments have experienced an average annual growth rate of 28%. Strong federal policies like the solar Investment Tax Credit (ITC), rapidly.

In 2024, net solar power generation in the United States reached its highest point yet at 218.5 terawatt hours of solar thermal and photovoltaic (PV) power. Solar power generation has increased drastically over the past two decades, especially since 2011, when it hovered just below two terawatt.

The world currently has a cumulative solar energy capacity of 850.2 GW (gigawatts). 4.4% of our global energy comes from solar power. China generates more solar energy than any other country, with a current capacity of 308.5 GW. The US relies on solar for 3.9% of its energy, although this share is.

Solar power includes solar farms as well as local distributed generation, mostly on rooftops and increasingly from community solar arrays. In 2024, utility-scale solar power generated 218.5 terawatt-hours (TWh) in the United States. Total solar generation that year, including estimated small-scale.

According to a 2024 report by the World Bank, off-grid solar has the potential to bring electricity to nearly 400 million people worldwide for the first time by 2030. Nearly every country in the world has the right combination of

geographic conditions, weather, and sunlight to generate all the.

Per capita figures are calculated by dividing total values by the population of the country or region. Population data is constructed by Our World in Data, based on various sources. Measured in kilowatt-hours per person. Ember (2025); Energy Institute - Statistical Review of World Energy (2025);. How many TWh does solar power generate a year?

Utility-scale solar generation grew to 232 TWh in the rolling 12 months through March 2025, according to the latest data from the Energy Information Administration.

What percentage of US electricity is generated by solar power?

A report from the National Renewable Energy Laboratory found that solar power accounted for 54% of new U.S. electricity generation capacity in 2023, with 22 states generating more than 5% of their electricity from solar, led by California at 28.2%.

Is solar power the future of electricity generation?

Solar continues to dominate new electricity generation capacity added to the grid in the United States, according to the Energy Information Administration's (EIA) latest release of its Electric Power Monthly report with data through March 2025.

How many people are employed in the solar industry?

3,975,096 people are employed in the solar industry worldwide, and 263,883 of these are in the United States. The solar energy industry created more new jobs in the US than any other energy subsector last year. It would take around 18.5 billion solar panels to produce enough energy to power the entire US.

How many GW of solar electricity generating capacity are there in 2024?

In August 2024, a total of 107.4 gigawatts (GW) of solar electricity generating capacity was operating in the Lower 48 states compared with 81.9 GW in August 2023, according to our Preliminary Monthly Electric Generator Inventory.

How much solar energy does the world use?

The world currently has a cumulative solar energy capacity of 850.2 GW

(gigawatts). 4.4% of our global energy comes from solar power. China generates more solar energy than any other country, with a current capacity of 308.5 GW. The US relies on solar for 3.9% of its energy, although this share is increasing rapidly every year.
