Power generation loss of the north-facing auxiliary solar panels

Overview

North-facing solar panels can reduce their performance by 30-40% over the course of a year. Panels turned away from the south generate less power, about 15 less when facing east or west, and around 30 less if facing north.

North-facing solar panels can reduce their performance by 30-40% over the course of a year. Panels turned away from the south generate less power, about 15 less when facing east or west, and around 30 less if facing north.

How much worse are north-facing solar modules?

We start with a typical residential system in Charlotte, North Carolina. We designed and modeled the system in HelioScope, our sales and design software platform. With a 2/12 pitched roof (9.5° tilt), the south-facing array will produce 1,361 kWh/kWp.

Yes, you can install solar panels on a north-facing roof, but efficiency will be lower compared to south-facing panels. However, with tilted mounting systems, high-efficiency panels, and microinverters, homeowners can still generate 50-85% of the energy they would on an ideal south-facing roof. Why.

Despite these obstacles, you will still see solar panels mounted on a North Facing roof from time to time. This is because in certain circumstances you can still create an efficient system that generates a decent level of energy for your investment. Next, let's look at how much energy you would.

In the early days of residential solar power, installing panels on north-facing roofs was generally considered a poor practice. You may have heard it before, or it may just make logical sense, "never place solar facing North." However, as solar technology has advanced and become more widespread.

There are many factors that go into solar panel energy production. The orientation, meaning the compass direction toward which they tilt, is one of the important factors. But you might be surprised at how little impact it really has. Here in Southwest Florida, we are pretty far south, so at mid-day.

North-facing solar panels are highly likely to be profitable if they can produce around 60% of the energy that south-facing panels can make. These panels consist of an assembly of solar cells that absorb sunlight as a source of energy. While installing north-facing solar panels on a roof may result.
