# Quality of flow battery cabinets in French communication base stations

## Overview

---

How many batteries does a communication base station use?

Each communication base station uses a set of 200Ah·48V batteries. The initial capacity residual coefficient of the standby battery is 0.7, and the discharge depth is 0.3. When the mains power input is interrupted, the backup battery is used to ensure the uninterrupted operation of communication devices.

Why do cellular base stations have backup batteries?

Abstract: Cellular base stations (BSs) are equipped with backup batteries to obtain the uninterruptible power supply (UPS) and maintain the power supply reliability. While maintaining the reliability, the backup batteries of 5G BSs have some spare capacity over time due to the traffic-sensitive characteristic of 5G BS electricity load.

What is base station energy storage battery schedulable capacity?

Base station energy storage battery schedulable capacity Spare battery capacity is divided into two types, which vary with load. The first type is the reserve capacity reserved to maintain availability. The second type is the schedulable capacity that can be transmitted to the grid.

When does a base station need a backup battery?

When the power supply of the grid is good or the base station load is in a state of low energy consumption, the backup battery of the base station is usually idle. Reasonable evaluation of the reserve energy required by the base station is the premise of its response to the grid dispatching.

Can BS backup batteries be used in distribution networks?

This paper evaluates the dispatchable capacity of the BS backup batteries in distribution networks and illustrates how it can be utilized in power systems. The BS reliability model is first established considering potential distribution

network interruptions and the effects of backup batteries.

How does a base station reserve energy storage model work?

Compared with the situation without considering the communication traffic, the base station reserve energy storage model considering dynamic changes reduces the peak load of the region by 3.65 %, the difference between the peak and trough of the load curve by 10.59 %, and the sum of load changes at adjacent moments by 17.50 %.
