Taipei Micro Power Station Power Generation Effect

Overview

Why is Taiwan building a power plant?

The plant is engineered to provide additional flexibility to Taiwan's power generation fleet, supporting the country's coal-to-gas transition along with enabling increased use of renewable energy (primarily from offshore wind farms), as Taiwan works toward a goal of achieving net-zero carbon emissions from power generation by 2050.

What percentage of Taiwan's energy will come from renewables?

The company aims for 60 percent of its energy to come from renewables by 2030, and 100 percent by 2040. That's a big reason why Taiwan's government is going big on solar and offshore wind power. It expects renewable energy generation to more than double from 9.5 percent of Taiwan's power mix last year to 20 percent in 2026. Chris Philpot.

Why is Taipower reengineering its grid?

The blackout, which started with human error at a large substation, revealed an overreliance on big plants sending power long distances over Taipower's grid backbone, he says. To increase reliability as it adds wind and solar power, Taipower has launched a radical reengineering of Taiwan's grid.

How can Taipower protect Taiwan's Fabs from grid disruptions?

But Taipower also seeks to make regions more independent and resilient to outages by building regional control centers, for example. And it is adding circuits that directly link power generation to industrial zones in a bid to protect Taiwan's fabs from grid disruptions.

How can Taiwan move towards cleaner energy?

Officials over the past decade have realized the need to move Taiwan toward cleaner energy, including transitioning from primarily coal-fired generation (about 43% of the energy mix in 2023, according to Taiwanese government

data) to more gas-fired power output (about 40% last year), and increasing the use of renewable energy resources.

How can Taipower improve power generation?

Taipower also argues that reducing the power transmission distance is among the best ways to reduce risks to the power grid, and it will therefore seek to reduce stress on the major south-north cables. Gaps in Power Generation
