# Wind Solar and Storage Transformation

## Overview

---

How does wind and solar integration affect battery development?

Voltage instability and decreasing grid inertia have emerged as significant side effects of growing wind and solar integration, shifting the market towards grid-scale storage solutions to balance supply and demand. Last year, the EIA estimated that developers would bring more than 300 utility-scale battery projects online by 2025 (9 GW).

Are wind and solar systems stable and resilient?

It is technically possible for wind and solar-dominant systems to be stable and resilient with the right mix of balancing and grid technologies. These systems are no more likely to experience blackouts than thermal generation-dominated systems. High wind and solar systems can be competitive with today's wholesale prices and grid costs.

What is the future of energy storage?

Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

Are wind turbines and solar panels the future of energy?

Wind turbines and solar panels have popped up across landscapes, contributing an ever-increasing share of electricity. In 2021 alone, nearly 295 gigawatts of new renewable power capacity was added worldwide. This trend points to a significant move away from the environmentally harmful practice of burning fossil fuels.

Does solar-wind system address future electricity demands?

Jiang, H. et al. Globally interconnected solar-wind system addresses future

electricity demands. Nat. Commun. 16, 4523 (2025). Peng, L., Mauzerall, D. L., Zhong, Y. D. & He, G. Heterogeneous effects of battery storage deployment strategies on decarbonization of provincial power systems in China. Nat. Commun. 14, 4858 (2023).

What is a wind and solar capacity factor?

The capacity factor, representing the output potential of wind and solar energy, is defined as the ratio of actual output to the rated nameplate capacity. We estimate hourly wind and solar capacity factors following our previous methods 1, 47.
