Wind power and energy storage ratio in 2025

Overview

The US Energy Information Administration (EIA) projects 32.5 GW of solar, 18.2 GW of energy storage, and 7.7 GW of wind will be deployed this year. These additions will make up nearly 93% of total new capacity, which is expected to hit a record 63 GW. From pv magazine USA.

U.S. Wind Power 2025 drives record capacity additions, with FERC data showing robust renewable energy growth, IRA incentives, onshore and offshore projects, utility-scale generation, grid integration, and manufacturing investment boosting clean electricity across key states. Overview of record wind.

We expect 63 gigawatts (GW) of new utility-scale electric-generating capacity to be added to the U.S. power grid in 2025 in our latest Preliminary Monthly Electric Generator Inventory report. This amount represents an almost 30% increase from 2024 when 48.6 GW of capacity was installed, the largest.

Recently, the U.S. Department of Energy's Energy Information Administration (EIA) predicted that by 2025, utility-scale solar capacity will reach 32.5GW, energy storage capacity will slightly exceed 18GW, wind power is expected to add 7.7GW, and fossil fuel natural gas capacity will increase by.

As the analysis reveals, 2025 will be a pivotal year for renewable energy technologies, battery storage, grid modernization, and sustainable fuels. For investors, understanding these trends isn't just about keeping up with market

shifts—it's about positioning for the long-term structural changes.

Dozens of large-scale solar, wind, and storage projects will come online worldwide in 2025, representing several gigawatts of new capacity. The Oasis de Atacama in Chile will be the world's largest storage-plus-solar project. Video used courtesy of Grenergy Key solar players like China and the U.S.
