

## Kongres Container

# Wind power generation on solar panels

## Overview

---

Hybridizing solar and wind power sources (min wind speed 4-6m/s) with storage batteries to replace periods when there is no sun or wind is a practical method of power generation. This is known as a wind solar hybrid system.

Hybridizing solar and wind power sources (min wind speed 4-6m/s) with storage batteries to replace periods when there is no sun or wind is a practical method of power generation. This is known as a wind solar hybrid system.

Wind turbines transform 60% to 90% of wind energy into electricity. Solar photovoltaic systems convert 20% to 25% of solar radiation into electrical power. The efficiency differential stems from fundamental differences in energy harvesting mechanisms and conversion technologies.

The generator of a wind turbine converts kinetic energy into electricity, and it does not respond to an equilibrium in the same way that a solar panel does. It will continue to create power as long as the wind blows and the turbine is turned on.

The solar and wind generator systems harness natural energy to produce electricity. Solar generators convert sunlight into electrical power, while wind generators use the kinetic energy of the wind to generate electricity.

As wind moves across solar panels, it creates a force known as wind load on solar panels. This force acts on the surface of the panel and tries to push or lift it. If the panels are not installed correctly or if the mounting system isn't strong enough, the panels can shake, shift, or even detach.
